

- How strong is the correlation between AGN evolution and SF?
  - On average? Individually? Short or long timescale?
  - Is there any hope to get rid of averaging SFRs?
  - Do we see enough black hole growth to account for the BH masses?
- Who drives what?
  - Any evidence for positive AGN feedback?
  - Can we identify sources with active negative feedback?
- What are the triggering mechanisms?
  - Are there enough & reliable morphological classifications for  $z \sim 1-2$  AGN?
